

Approach to minimize the risk of Coccidiosis

Coccidiosis is one of diseases to damage egg farm operations influencing productions and bringing about considerable medicine expenditure. Coccidiosis is coming by birds picking manure.

HYTEM is offering two approaches to minimize Coccidiosis risk.

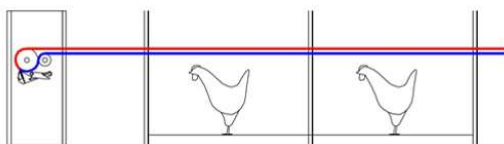

One is 360. Auto Stop utilizing HYTEM non slipping Manure Collector with Rubber coated drive roller & Full-width pinch roller.

The cleaner manure belt ceiling side is to be kept.

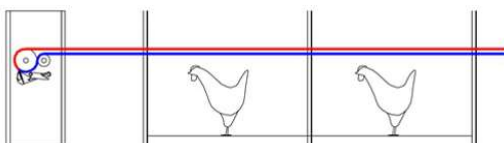

Before manure collection

- Manure belt (manure receiver side)
- Manure belt (cage ceiling side)

- ① When manure collection is finished, the belt is upside down.
- ② The belt keeps running is until it complete a round. *Manure collection automatically begins at a next row.*

The manure belt stops when it returns to the original position.

Another approach is Super Clean 26.

This approach is more complete to prevent Coccidiosis, but the cost will be higher.

Prevents chickens from pecking the manure belt with one-inch square meshes placed 26 mm away from the manure belt
